Preliminary results of Wayne State & Co. water study. See p. 3 for takeaway points. **The team is not ready to make a blanket statement about the water being safe.** Certain findings around bacteria and chlorine are sources of concern and call for further study. It's also important to note that sampling during the warmer months of 2017 will be essential before firm scientific conclusions can be reached. Any questions, let me know!

William Hammond What I find most disturbing is the statement that "the use of point of distribution filters (faucet) increases the presence of bacteria"!!
